## Intro

- In this section we're gonna implement Stripe.
- When testing, from StripeService, I should mock **Charge.create**(params, requestOptions) because otherwise I'd invoking the real API with a card number that doesn't exist and it doesn't make sense. Also a test should be as fast as possible so if it could be done, it would not be recommended.
- The problem is that create() is a static method so there is not way for it to mock this static method. So we have two options. One, I can use an external framework like PowerMockthat that allows to mock static methods. Usually people avoid using as many frameworks as possible.
- Because we cannot mock a static method a technique is grab that line into a method from a service so that we can mock it.
